

Overview of National Electrical Construction and Testing Services (ECTS) License Program

Electrical Construction and Testing Services (ECTS) is an association of independently owned companies working together under a licensing agreement, to provide national electrical testing and maintenance services throughout the U.S.

The concept is to establish a national network of electrical testing and field services companies in order to provide national coverage subject to national standards and quality control, yet able to compete with locals. Once this is established, we believe that there is a huge market to sell this concept to national companies. We also foresee that these ECTS companies will be resellers of the other TDS products and services (rentals & sales of test equipment, training, cal & repair, infrared, etc.). The objective is that ECTS will provide a higher level of quality testing, and be a reseller of other products and services at a cost lower than that of large national companies and will be cost competitive with the less qualified, local testing companies. To help establish this organization and help book contracts, the initial license partners (IL's) will be compensated, as listed below.
